Microsoft Word Programs

Charles Kenyon (**wordfaq@addbalance.com**)
(personal observations)

Different Word programs on different platforms

Microsoft publishes a number of programs, all called "Word" and all able to edit and create Word files to a different extent.

See Compare Word features on different platforms. *This is an archival copy; the current page is Word Features Comparison: Web vs Desktop but that page does not cover many of the programs that are addressed in the archival copy.*

- There are **multiple programs**, all named Word, and all created and published by Microsoft. This can be confusing when trying to get help.
- They all edit the same document files that have the same file structure. Some of the programs have no control over some of the document structures.
- They may all be called Microsoft 365 or Word 365 if using the subscription plan. If it is called Office 2024 (2019, 2019, 2016, etc.) it is the perpetual license version which is only the desktop programs. The perpetual license versions with a year number only work in a Windows or Mac OS environment.
- But, they are **different programs** with different features and controls. *Note that most users never come close to using all the features offered in the desktop versions of Word.*

Windows Desktop Program

As of January 2025, the most powerful Word program, with the most features, remains the **Windows desktop** application from Microsoft 365. I do not expect that to change. The perpetual license version Word 2024 is very close as far as features but does not receive new features as added. It is only for use on a single device. *The perpetual license versions of Office/Word is only the desktop applications and does not include the online or mobile versions.*

Macintosh Desktop Program

The **Macintosh** desktop application is a close second in the number of features. The things available in the Windows version not yet on the Mac version include Content Controls, Building Blocks, and ActiveX. It can use, but cannot create, or modify most Content Controls. AutoText is a Building Block that the Mac can and does use. The Mac version lacks the more powerful tools to manage styles available in the Windows version through the Manage Styles Dialog. See How do I manage styles? Mac User. *(Look at all of the responses, not just the one marked as an answer.)*

Browser / online program

The **browser** version of Word – Word Online version does not print directly, only by first saving as pdf. This browser version has far fewer features and editing in it has been reported to mess up automatic numbering/bullets.
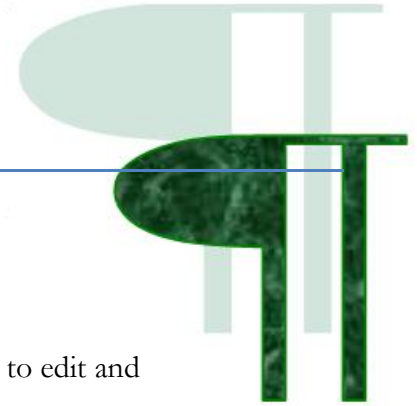

Chromebooks

Chromebooks use a version of this or of the Android mobile app. See [How to access Microsoft Office on a Chromebook](#). This can only be used with documents stored on OneDrive or SharePoint. See: [Differences between using a document in the browser and in the Word desktop application](#). I would use this for note taking and for quick viewing/printing, but not for editing. Especially not for editing long or complex documents. The ability to mess these up is too high.
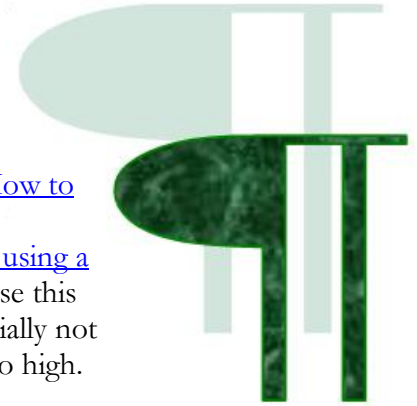

Mobile Apps – Android/IOS

The **mobile** apps (Android/IOS, etc.) vary somewhat but have far fewer features. I would use them for note taking and for quick viewing/printing, but not for editing. Especially not for editing long or complex documents. The subscription versions are more powerful than the free ones but not, IMO, significantly. Primarily these can only be used with documents on OneDrive or SharePoint. *(Usually, you can get at documents on your local device, but it is tricky.)* [What you can do in the Microsoft 365 apps on mobile devices with a Microsoft 365 subscription](#) See also [Word for Android Phones Help](#), [Word for Android Tablets Help](#), [Word for iPhone Help](#), [Word for iPad Help](#).

When seeking help, it is important to give the program that you are having problems with as a part of your question.

I see using Word on anything other than the desktop applications as supplemental to the desktop applications, not a replacement. Note that the statements about capabilities and usefulness are my opinions, not anything from Microsoft. They are based on my use and on my observations over the years here and in other Word forums. In my opinion, none of the versions is perfect. They can all be useful, recognizing their limitations.

Microsoft Word Free – Free Word – Free Office

Microsoft has never offered a free version of Word on new computers. Some manufacturers have included it in their purchase price, though.

- Every Windows computer comes with **[WordPad](#)**, which is a functional word processor, included at no extra charge. It has nothing near the features of Word but is more than a basic text editor. This is being removed in Windows 11, though.

  - [Save your WordPad before its too late!](#) – Woody's Watch

  - [Software Alternatives to WordPad](#) – Woody's Watch

- Word represents a lot of work by a lot of people.
  They were paid by Microsoft for their work.

- Some *manufacturers* purchase Office (at a discount) and include it in their price. Most *manufacturers* include a free trial version of Microsoft 365 that expires after 30 days. **This can conflict** with purchased perpetual license versions of Word.

- Microsoft offered Office 2010 Starter to *manufacturers* at a very cheap price. It was a *reduced-feature* version that included ads. Many manufacturers paid for that and included it on their computers at no extra charge *(that was revealed to the consumer)*.

- Microsoft Office Online free, but… This is a set of online programs with the same names as the desktop applications but with reduced functionality.

You can use GoogleDocs or OfficeLibre, both are free and read and write Word-compatible files. (The files are *not* identical to Word files but can be read and edited in Word.) Word online files are identical.

This document was prepared for a talk about Word in January 2025 and expands a bit on what I usually write in forums. Again, it states my personal opinions.

I do not work for Microsoft.

Background

I have been using Word since Word 95 on Windows 3, but really started with Word 97. I started programming after reading *Word 97 Annoyances* by Woody Leonhard.

Some of my web pages:

- Intermediate Users Guide to Microsoft Word – Templates Chapter
- Automated Boilerplate Using Microsoft Word – chapter in Usersguide
- Understanding Styles in Microsoft Word – chapter in Usersguide
- Use Body Text Style Instead of Normal Style – addendum to one of Shawna Kelly's tutorials
- Using Date Fields in Microsoft Word
- Moving (Sharing) Customizations in Microsoft Word
- Master Documents "Feature" in Microsoft Word
- Downloads - Microsoft Word - Add-Ins - Tutorials - Letterhead - Templates
- Startup Folder in Word – auto-load global templates
- Opening or Finding the Normal template in Word
- Modifying the Quick Access Toolbar (QAT) in Microsoft Word
- How can I get a different header/footer on the second page?
- Repeating Data Using Document Property Content Controls and Other Mapped Content Controls
- Frames and Textboxes in Microsoft Word
- The Ribbons of Microsoft Word 2007-2024(365) –different versions
- Function Keys in Word 97-2024 (365)
- Moving/Reorganizing Pages in Microsoft Word
- No Copies - No Editing
